# ECOSYSTEM "SANTRAST"

---

**T**he ecosystem of the project is built on our multiplier, which includes a system of interaction between cryptography and the real sector of the economy, as well as making a profit for the followers and participants of the project.

In previous years, cryptography has gone through many transformations and with the advent of DeFi protocols, solving our problems has become much easier. In fact, our idea that requires the development of many tools is transferred to the DeFi technology and will be spread in this area.

The basis of the idea is that the entire system of the crypto industry is self-contained and has excess liquidity. In fact, what is happening is caused by the uncontrollable growth of bitcoin, as well as its systematic ups and downs associated with the computing power for its production and maintenance of the network itself. In turn, the rest of the altcoins follow its market movement.

The scheme of interaction with the real sector of the economy is as follows:

The business community today is faced with a number of difficulties in the development of their business, this is due to a number of reasons.

1. High competition and lack of working capital for the development of your business
2. Tax legislation, excessive pressure from regulatory authorities, high tax burden

3. Inflation, decline in the purchasing power of the population. Difficulties in promoting products and services
4. To attract additional investment, entrepreneurs have to overcome a lot of administrative barriers, reserve capital on trading floors, pay all kinds of fees, pay for the work of specialized specialists, etc., for the majority this becomes insurmountable obstacles.

The development of our strategy based on blockchain with its own crypto currency will allow any representative of the entrepreneurial community manage your capital as efficiently as possible, as well as neutralize or minimize the above problems of classical economics.

The solution lies in the creation of synthetic derivatives included in the ERC 20 token based on the ETH blockchain Avalanche network.

Let's look at an example of how this would work.

Suppose that businessman Aleksey manufactures accessories for mobile phones. He has good sales and especially the product (x), he wants to expand the production of this product and he needs additional investments, but he does not have them. Then he becomes our partner. We, in turn, create a synthetic derivative backed by commodity (x) and call it token (x), and also create several pools of liquidity:

- First pool "SNRW" \* (X)
- Second pool "SNRW" \* "USDT".

Since the second pool was created initially, it accumulates liquidity of one of the assets in favor of "USDT" after which investors can exchange the "SNRW" token for a token (x)

It follows from this that the entrepreneur Alexey received a valuable crypto asset with practically zero investments.

"Santrast" under the terms of the deal places 50% of the tokens (x) in liquidity pools paired with the "SNRW" token,

30% is transferred to the customer, 20% remains in the "SNR" reserve wallet and will be included in the "SANTRAST" asset base, thus the base cost of the "SNR" itself and the token (x) increases, and the demand for "SNRW" also increases. Investors have the same opportunities. In combination with the "Pangolin DEX" protocol, it is possible to approximate any marketing strategy, accumulate assets, reserve in liquidity pools for extra profit, make speculative transactions, transfer assets to other trading platforms.

Our strategy, combined with DeFi, will allow entrepreneurs to create completely synthetic derivatives for their businesses, goods and services for every single position with absolute freedom. These derivatives will be included in smart contracts based on DeFi protocols.

Thus, we solve several problems at once.:

1. Raising additional capital bypassing administrative barriers
2. Overcome the first competitive advantage and compete freely with major players in pricing policy. The ability to attract additional customers, increase purchasing power
3. Keep your capital in a crypto asset not subject to inflation
4. Avoid undue attention of regulatory authorities, saving money on administrative resources
5. There is no need to reserve colossal capitals to attract additional investments, to attract borrowed funds
6. Free exchange of crypto assets into fiat capital on third-party crypto exchanges
7. Participants will gain access to additional liquidity from sectors of the economy that were not previously available.

The Santrast project also has its own SNR derivative and will initially be implemented under the same scheme.

## "SNR" AND "SNRW" TOKENS

---

**S**"SNR" is an ERC 20 token built on the basis of Ethereum and is a synthetic derivative of the Santrast project, the "SNRW" token is an internal cryptocurrency of the project also built on the basis of Ethereum and is intended to implement marketing strategies. Total issued 1 000 000 "SNR":

- 20% of the available “SNR” coins will be reserved and will be put into circulation at the discretion of the project administration
- 5% of “SNR” will be distributed among the project participants. 75% will be put into circulation.

The deadline for the full launch of the project is June 30, 2024. The start date of the project is considered to be the reservation of funds in the liquidity pool on the Pangolin platform

The initial placement of "SNR" is made on the decentralized exchange "Pangolin" (<https://info.pangolin.exchange>), in the future it will be placed on other sites.

The "SNRW" token has been issued in the amount of 1,000,000,000,000 units:

- 10% will be distributed among the organizers of the project

- The rest is placed in parts in liquidity pools, see the amount of placement on the official website in the releases section.
- Asset reservation wallet address  
0x41D0ae702C8aF2e52ea8c7b29ff3cB660151EFBa

## NETWORK “AVALANCHE” AND “PANGOLIN” DEX

---

**A**t the time of this writing, London has been updated on the ETH network, and by the end of 2021 it is planned to switch the Ethereum network to version 2.0, according to the assurances of the developers, this will reduce commissions several times, but at the moment it is not clear how events will develop and commissions continue to grow ... Also, the ETH network miners impose restrictions on the developers of new Dapps, which leads to a bad user experience and forces them to switch to alternative networks.

After assessing all the risks associated with these events, our team decided to deploy their project in the Avalanche network and make an initial placement of their assets on the Pangolin DEX platform.

We do not abandon the concept outlined in white paper and will develop our project in this direction. Since Pangolin is a relatively young project and little liquid, we had an idea to increase the SANTRAST asset base, as well as to increase trade turnover in Pangolin DEX itself.

The essence of the idea is very simple, place our assets in liquidity pools, transfer part of the funds to the ETH network to buy out assets circulating on the ETH network exchanges. With the help of an avalanche bridge, we transfer them to the “Avalanche” network for subsequent placement

on the “Pangolin” DEX in liquidity pools only in tandem with “SNRW”.

The “SANTRAST” tokens deployed in the Avalanche network have the same symbols as in the ETH network. The number and distribution of tokens are distributed as originally planned:

- Contract address “SNR.e” symbol “SNR”  
x0c56938dc4be6fc6b5641445be21644797ce251a
- Address contract “SNRW.e” symbol “SNRW”  
0xe677bdc4f5ac7ef7701f4199f25abad34d41fd7f

Contracts deployed on the Avalanche Mainnet C-chain are marked with (.e).

## OUR TEAM

---

**T**he team of our project consists of specialists with many years of experience in the industries required for its development, as all the creators of the project wished to remain anonymous.

- The head, developer and mastermind of "Santrast" has over 10 years of investment experience, a specialist in crypto projects.
- Leading financial analyst, expert in the development of investment strategies, a successful trader, more than 10 years of experience.
- Marketer, specialist in the field of promoting goods and services, entrepreneur with more than 20 years of experience.
- IT specialist, web designer, CRM systems developer, entrepreneur, over 20 years of experience.
- Project investor, successful entrepreneur, large business owner, over 20 years of experience.

# 4.

## SANTRAST GOALS AND STRATEGY

---

**T**he purpose of the first stage is the implementation of a marketing strategy, partial reinvestment, reservation-  
placement in additional pools of liquidity

2. The second stage is the formation and development of an independent blockchain with its own crypto currency
3. The third stage is the reorganization of the company into an open joint stock company and entry into the international market through an IPO
4. The fourth stage is the creation of your own decentralized and centralized crypto exchanges
5. The fifth stage is the integration of your own cryptocurrency through our exchanges into the real sector of the economy.

# 5.

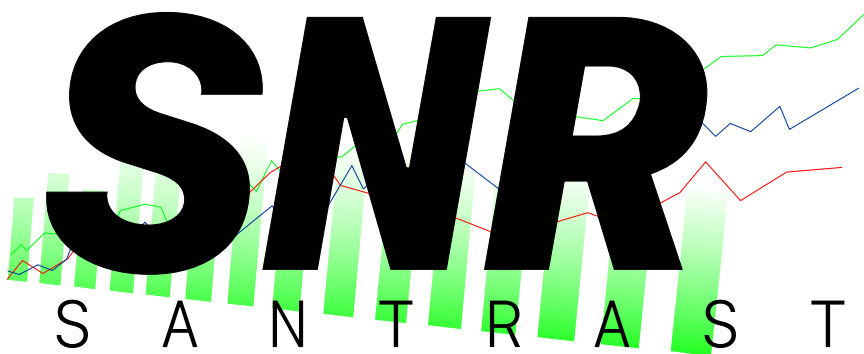

## CONCLUSION

---

**A**fter analyzing the crypto market, the team of our project came to the conclusion that we have competing projects such as “Sintetix”, “Minter”, “Poligon” and others.

Our main difference from these projects:

1. We create our own market, the turnover of assets in which occurs only with our local currency.
2. Unlike competing projects where all processes are chaotic, "SANTRAST" organizes the crypto community in a given direction, predictable and understandable.
3. The project has no analogues, cross-platform structure.

The logo features the letters 'SNR' in a large, bold, black sans-serif font. Behind the letters is a green bar chart with vertical bars of varying heights. Overlaid on the chart are three line graphs in green, blue, and red, showing fluctuating trends. Below the 'SNR' text, the letters 'S A N T R A S T' are spaced out horizontally in a smaller, black, sans-serif font.

## ABOUT THE PROJECT

---

Decentralized cross-platform project that unites the crypto industry and the real sector of the economy. Created by the community for the community.

We are introducing a new concept for this project "Cross-platform staking»

The "SANTRAST" project is a tool that will unite the assets of Russian and European companies involved in advanced high-tech sectors of the economy and the entire business community.

At the time of the release of the "SNR" token, the project is at the start-up stage. Token holders will be participants in a financial innovation that has no analogues.

The SNR token is the world's first blockchain project with a basic return. The proceeds will be used to increase the company's asset base and support high-tech startups, the development of medicine, renewable energy, environmental protection and restoration.

SNRW is part of the SANTRAST project, it is an asset with a variable value, interacts with the SNR contract and the

PANGOLIN DEX protocol, is designed to hedge investor positions, increase liquidity by recalculating cross rates, preventing a decrease in liquidity during market downturns and increasing it during rallies. It has a super high yield.
